[A new method for the screening of the colony-forming capacity of the bone marrow stem cells: application to mice with burn injury]. The authors describe a new method for screening the colonyforming capacity of bone marrow stem cells in the body of mice, which was developed by their group. The method consists of bone marrow transplantation and the application of a neutral red staining to the tail skin of a recipient mouse. Seven days after the transfer, the neutral red solution was applied to the recipient mouse's tail skin and the time of taking up the solution was measured. The correlation between the application time and the bone marrow stem cell number in the recipient mouse was investigated and the ratio of cell-to-cell colonies obtained in the bone marrow and in the recipient mouse was compared. The number of bone marrow stem cells transplanted into the recipient mouse was calculated from the correlation and the ratio of the cell-to-cell colonies. The method for screening the colony-forming capacity of bone marrow stem cells is simple and reliable and can be performed using an animal which can be induced to develop a burn injury in a short time.an esta es una mano.
