## **FileEventWatcher Crack+ Free X64 (Final 2022)**

Rating: Ease of use Performance Download speed Support Features It creates a list of all files and folders that have been changed, created, deleted or renamed in a specified directory. It can monitor a single directory, a hard drive, a removable disk or a virtual drive. The program can specify any application (specified by file path) to be launched on events, such as File Creator, Media Player, Web Browser, FTP Client, BitTorrent Client, etc. It displays log entries for events, e.g. the modified date and time for files as well as the name and path for changed directories. FileEventWatcher offers a simple and clean interface with a set of simple options. It does not require .NET Framework to function. To specify a directory or a file that should be monitored, it is needed to click on the files and folders that are located on the computer and choose the desired ones from the list that's created. After that, a Log Window opens where all log entries for file changes are displayed; however, only the file and folder names are displayed, with the modified date and time, the application name and its path on the computer. It does not display the creation date or the path to the file. The program can monitor a single directory, a hard drive, a removable disk or a virtual drive and it can monitor files and folders regardless of whether they are hidden or displayed, not to mention that you can specify any application to be launched on file changes, such as File Creator, Media Player, Web Browser, FTP Client, BitTorrent Client, etc. It shows a list of the files and folders that have been created, modified, deleted or renamed, the application they were opened with and the path on the computer where they were located. It can monitor a single directory, a hard drive, a removable disk or a virtual drive and it can monitor files and folders regardless of whether they are hidden or displayed, not to mention that you can specify any application to be launched on file changes. ## FileEventWatcher Crack +

FileEventWatcher allows you to monitor a directory and any application you've defined for its creation, modification, deletion or renaming. Units: The main screen of the program consists of two parts. The upper one displays the desired directory for monitoring, while the bottom one displays application logs. In order to properly monitor a folder, you need to select it in the drop-down list (dir = the full path of a directory), and then specify an application name in the top-right part of the program. However, the program doesn't force you to choose an application of your preference: regardless of the file modification type, it will launch the designated application with the path to the logged file. In order to have an overview of all modifications in the monitored folder, you need to select the events log (eventlog = checkbox) at the bottom of the window. By default, the programs launched for events are shown on the log; you can also select the option of displaying the pop-up messages on the monitor screen. By clicking the Edit menu, you can change the directory path, or apply a file mask instead. Note that the option to automatically save events to a file is not available here. Editing options The application editor allows you to specify the application that should be launched on file creation, modification, deletion or renaming, as well as to select the directory and file mask parameters. The log section is composed of the log text area and buttons. On the left you can edit the log text, and on the right you can select the filter used to find out the log content. By default, FileEventWatcher is supposed to log all file events; therefore, the only filter option is that of filtering out unwanted contents. Since the program's interface lacks help menu, we'd strongly advise using the program's online documentation instead. Advantages: The program can monitor directories for the creation, modification, deletion or renaming of files, and launch any program if the event takes place. The program doesn't set up any system registry settings, and requires Microsoft's .NET Framework to be installed on the system. Disadvantages: The interface is quite basic and not very intuitive to use, there's no option to monitor multiple folders at a time, nor to automatically save log details to file. Full Package Requirements: .NET Framework 4 or later .exe installer (19.6 MB) Moldova.Info License
