xforce keygen 64-bit autocad is not a free program but i can not have the licence myself. in fact the windows x64 bit.// copyright ©2015 the gonum authors. all rights reserved. // use of this source code is governed by a bsd-style // license that can be found in the license file. package gonum import "gonum.org/v1/gonum/blas" // dlaau performs the lu decomposition of a into an unblocked m x n matrix u // and an n x n matrix d. // a is a rectangular matrix stored in rows and columns (nrow x ncol). // on entry, the elements of the first and second pointers must // have their usual meaning and are interpreted as follows: // first points to the first nrow x ncol panel of the active submatrix // of a. // second points to the first nrow x ncol panel of the private // work space used in dlaau. // on exit, first is overwritten. // work points to an uninitialized 2 x nrow x ncol panel of d. // in this version, first will always have the meaning that it has in // dlaau, and thus a call to dlaau will overwrite it. // work must have at least 4 x nrow x ncol x ntype(1) \* min(nrow, ncol) elements. // if work is not large enough, dlaau will compute workspace that is // both smaller and longer. // if an error is occured during the computation, then work(i,.) will be set // to the largest positive value which does not cause a divide by zero. // example(dlaubu) // dlaub returns the lu decomposition d of the n x n matrix a. the matrix a // must be stored in a row-major form and the result of the lu decomposition // is written into the unblocked m x n matrix u and the n x n matrix d. // a and u contain the same data, but in different formats. // dlaub works on the first nrow x ncol panels from the leading diagonal of a. // thus, the arguments are interpreted as follows: // a - matrix to be lu decomposed into u and d. // lda - leading dimension of a. // u - m x n matrix of the l part of the matrix. on exit, the contents of // the m x n matrix u are stored in the first m+1 rows of work.
